FAST FACTS

1. AI techniques have demonstrated an ability to help physicians diagnose patients with a variety of cancer types by recognizing biomarkers that may be difficult to identify on scans and tests.

2. A top priority for the use of AI in cancer diagnosis is to accurately distinguish between benign and malignant lesions, which could reduce the number of unnecessary procedures performed on patients, improving their quality of life and lowering overall health care costs.

3. Clinicians should not worry about being replaced by a machine, but instead, they will have extra tools needed to diagnose and treat complex forms of cancer.
